

**Amendments to the Claims:**

This listing of claims, in which claims **6, 7, 18, 22, 25** and **28** are amended and claims **31-35** are newly added, will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

- 1   **Claim 1** (original): A device for visually inspecting optical component comprising:  
2           a borescope, said borescope having a borescope insertion tube and an optical lens  
3           for viewing a target; and  
4           borescope insertion tube adapter for adapting the borescope insertion tube to an  
5           optical component to be inspected.
- 1   **Claim 2** (original): The device recited in claim 1 above, wherein the borescope insertion  
2           tube adapter further comprises:  
3           an adapter body, said adapter body being compatible for mating with the optical  
4           component to be inspected.
- 1   **Claim 3** (original): The device recited in claim 2 above, wherein the borescope insertion  
2           tube adapter secures the borescope insertion tube at a predetermined position  
3           within the adapter body.
- 1   **Claim 4** (original): The device recited in claim 2 above, wherein the predetermined  
2           position within the adapter body is within an effective focal distance for the  
3           borescope.

1 **Claim 5** (original): The device recited in claim 2 above, wherein the borescope insertion  
2 tube adapter further comprises:  
3 a protective sleeve disposed between said borescope insertion tube and said  
4 adapter body.

1 **Claim 6** (currently amended): The device recited in claim 5 above, wherein the  
2 protective sleeve further comprises:  
3 a lock ~~of~~ for securing the protective sleeve to the borescope insertion tube.

1 **Claim 7** (currently amended): The device recited in claim 2 above, wherein the adapter  
2 body is one of ~~an~~ SC, ST, FC, E2000, LC, LX, MU, MT ~~components type~~  
3 component types.

1 **Claim 8** (original): The device recited in claim 2 above, wherein the adapter body  
2 cooperates with a shutter on the optical component to be inspected.

1 **Claim 9** (original): The device recited in claim 2 above, wherein the adapter body  
2 cooperates automatically actuating a shutter on the optical component to be  
3 inspected simultaneously during insertion to said optical component to be  
4 inspected.

1 **Claim 10** (original): The device recited in claim 2 above, wherein the borescope further  
2 comprises:  
3 a video camera for capturing images of a target on the optical component to be  
4 inspected.

1 **Claim 11** (original): The device recited in claim 6 above, wherein the borescope further  
2 comprises:  
3 a video camera for capturing images of a target on the optical component to be  
4 inspected.

1 **Claim 12** (original): The device recited in claim 2 above, wherein the borescope further  
2 comprises:  
3 a light emitter for illuminating a target on the optical component to be inspected.

1 **Claim 13** (original): The device recited in claim 11 above, wherein the borescope further  
2 comprises:  
3 a monitor for displaying images of the target on the optical component to be  
4 inspected.

1 **Claim 14** (original): The device recited in claim 2 above, wherein the adapter body is  
2 configured such that said borescope insertion tube adapter is maneuverable while  
3 mated with the optical component to be inspected, whereby the position of the  
4 optical lens is adjustable.

1 **Claim 15** (original): The device recited in claim 2 above, wherein the optical component  
2 to be inspected is one of a MU, MT, LC and LX type configured on a high density  
3 optical port.

1   **Claim 16** (original): A method for implementing a borescope for visually inspecting  
2           optical component, said borescope having a borescope insertion tube coupled to  
3           an adapter body and an optical lens received therein, said optical lens for viewing  
4           a target portion on an optical component comprising:  
5           engaging the adapter body to the optical component with the target portion to be  
6           inspected; and  
7           visualizing the target portion of said optical component through said borescope.

1   **Claim 17** (original): The method recited in claim 16 above, wherein engaging the  
2           borescope insertion tube adapter to the optical component further comprises  
3           coupling the borescope insertion tube adapter to the optical component.

1   **Claim 18** (currently amended): The method recited in claim 17 above, wherein prior to  
2           inserting the borescope insertion tube adapter into the optical component, the  
3           method further comprises:  
4           securing the adapter body to the borescope insertion tube at a predetermined  
5           position within the adapter body; [,]and  
6           securing the borescope insertion tube at a predetermined position within the  
7           adapter body.

1   **Claim 19** (original): The method recited in claim 17 above, wherein the predetermined  
2           position within the adapter body is within an effective focal distance for the  
3           borescope.

1   **Claim 20** (original): The method recited in claim 17 above further comprises:  
2           disposing a protective sleeve between said borescope insertion tube and said  
3           adapter body.

1 **Claim 21** (original): The method recited in claim 20 above further comprises:  
2 locking the protective sleeve to the borescope insertion tube.

1 **Claim 22** (currently amended): The method recited in claim 17 above, wherein the  
2 adapter body is one of ~~an~~ SC, ST, FC, E2000, LC, LX, MU, MT ~~components~~  
3 ~~type~~ component types.

1 **Claim 23** (original): The method recited in claim 17 above, wherein coupling the  
2 borescope insertion tube adapter to the optical component further comprises:  
3 operating a shutter on the optical component to be inspected.

1 **Claim 24** (original): The method recited in claim 23 above, wherein operating a shutter  
2 on the optical component to be inspected further comprises:  
3 actuating a shutter on the optical component to be inspected simultaneously  
4 during insertion to said optical component to be inspected.

1 **Claim 25** (currently amended): The method recited in claim 17 above further comprises:  
2 capturing images of the target portion of said optical component to be inspected.

1 **Claim 26** (original): The method recited in claim 21 above, wherein the borescope  
2 further comprises:  
3 a video camera for capturing images of a target on the optical component to be  
4 inspected.

1 **Claim 27** (original): The device recited in claim 17 above further comprises:  
2 illuminating the target portion of said optical component to be inspected.

1   **Claim 28** (currently amended): The method recited in claim 26 above further comprises:  
2           viewing an image [images] of the target portion of the optical component to be  
3           inspected.

1   **Claim 29** (original): The method recited in claim 17 further comprises:  
2           maneuvering the adapter body while engaged with the optical component to be  
3           inspected.

1   **Claim 30** (original): The method recited in claim 17 above, wherein the optical  
2           component to be inspected is one of a MU, MT, LC and LX type configured on a  
3           high density optical port.

1   **Claim 31** (new): The device recited in claim 2 above, the adapter body having an  
2           exterior body dimension and the optical component to be inspected having an  
3           interior component dimension, wherein an annular space is formed between the  
4           adapter body and the optical component, a magnitude of said annular space being  
5           approximately equivalent to the difference between the exterior body dimension  
6           and the interior component dimension.

1   **Claim 32** (new): The device recited in claim 31 above, the magnitude of said annular  
2           space being sufficient for manipulating the adapter body within the optical  
3           component, thereby redirecting a viewing axis onto multiple targets.

1   **Claim 33** (new): The device recited in claim 32 above, wherein the optical component is  
2           a matrix adapter and the target portion and the second target portion are first and  
3           second optical fibers in a plurality of optical fibers connected to said matrix  
4           adapter.

5   **Claim 34** (new): The method recited in claim 16 above, the adapter body having an  
6           exterior body dimension and the optical component to be inspected having an  
7           interior component dimension, wherein an annular space is formed between the  
8           adapter body and the optical component, a magnitude of said annular space being  
9           approximately equivalent to the difference between the exterior body dimension  
10          and the interior component dimension, the method further comprising:  
11          visualizing a second target portion by manipulating the adapter body within the  
12                  optical component, thereby redirecting a viewing axis onto the second target  
13                  portion.

1   **Claim 35** (new): The method recited in claim 34 above, wherein the optical component  
2           is a matrix adapter and the target portion and the second target portion are first  
3           and second optical fibers in a plurality of optical fibers connected to said matrix  
4           adapter.
